Dear Lumber or Truss Dealer;

Thank you for your interest in the Iron Steer Lumber roll off and Semi Stretch Truss Trailers. Our goal is to provide you with a trailer which delivers material fast, economically and without damage.

Iron Steer Trailers has been building Gooseneck lumber roll off trailers for eleven years. They have grown in popularity with lumberyards all across the United States. With the introduction of longer models and the I joist Support on the neck they have also become popular with those who deliver trusses and long length engineered wood products.

Dexter axles, Goodyear tires, Williams hydraulic pumps, Interstate batteries, Valspar paints, LED lights and 1 ¼” re-lube bearings on the rollers are some of the standard components used to produce our reliable, low maintenance, high quality IRON STEER TRAILERS.

All IRON STEER roll off trailers are equipped with twin cylinder hoists with stabilizer. Their low dumping bed angle and roller brakes provide excellent load control to prevent damage to product being rolled off, whether it be palliated goods such as singles, dry wall, framing material or long engineered wood products.

NEW! In 2005, Iron Steer Trailers introduced a line of Semi Stretch Trailers to expand our product line and fill the needs of the larger truss plants. The Semi Stretch Trailers provide the same quality and workmanship that has become a trademark of all Iron Steer Trailers. The new trailers have some unique features never before available on stretch trailers. Such as the hand held radio remote over air control of all trailer functions (Axle slide – Stretch – Roller locks – Roller brakes and Hoist). The Power cable and air lines on the stretch and slider are supported and enclosed in energy chain. The fabricated frame over the fifth wheel and the low pivot point on the hoist provide a lower profile with ample lift.

Additional pictures and specification will be posted on the web site as they become available. Please call LeRoy at 1-800-644-6247 for more information.
